

RACAL ACOUSTICS

RA112 Jetlite

LIGHTWEIGHT HEADSETS

The Jetlite lightweight headset has been designed by Racal Acoustics for the professional communicator, where clarity of speech, comfort and reliability are of major importance during long periods of operational use.

APPLICATIONS

Its versatility allows Racal Acoustics to offer a version to meet a wide range of operations from air traffic control, aircraft flight decks and control rooms through broadcasting, with its many varied requirements, to a basic one to one communication. The wide range of options available enables the Jetlite to be offered for most applications and equipment fits.

PRODUCT DESCRIPTION

The Jetlite consists of a lightweight spring headband on to which are fitted two tough moulded earshells with integral earphones. The ear cushions are circumaural (around the ear) and the replaceable padded headband cover offers both stability and comfort to the user for long periods without undue pressure.

A series of microphones are available offering optional impedances and sensitivities. Both fully flexible and rigid boom arms are available.

An amplifier to simulate carbon microphone performance can be fitted inside the earshell, if required. The headset is supplied with a 2m cable, unterminated as standard.

However, alternative cable lengths, PTT switches and connectors can be fitted to suit the user's specific requirements. The upper termination is a quick release connector which interfaces with the headset download.
